

# SoftUni Forum Workshop - Part 2

This application is created as a workshop for the [Angular Corse](#) @ [Software University](#)

## Task Requirements

So far, we have created **one dynamic page** which **lists all themes** sorted by two different criteria. The next step is to implement **few more pages** and **route between them**. You will be provided with **HTML** and **CSS** skeleton for all other additional pages that you must create. There is one catch, half of these pages require **authentication**. You must create some **properties** or **services** that **fake** this **authentication**. Because we don't know yet how to manipulate **forms** properly or the real case with the authentication and authorization. We will fix that later when we have the knowledge to do so.

## Logged in navigation bar

When the "user" is "logged in" he should see the following navigations:

The mini nav-bar includes:

- [Username's profile] a-tag should refer to the profile page ("localhost:4200/profile ")
- [Logout] a-tag should refer to ("localhost:4200/logout")

The nav-bar below the logo of the SoftUni forum includes:

- [Home] a-tag should refer to the home page ("localhost:4200/home")
- [Themes] a-tag should refer to the "page with all themes" ("localhost:4200/themes")
- [New Theme] a-tag should refer to the "create theme" ("localhost:4200/add-theme")

## Not logged in navigation bar

When the user is "not logged in" he should see the following navigations:

The mini nav-bar includes:

- [Login] a-tag should refer to the home page ("localhost:4200/login ")
- [Register] a-tag should refer to ("localhost:4200/register")

## Home page (Not Logged in)

This is the home page ("localhost:4200/home"). This is a welcome user page. The welcome component that we have already can be reused here. All "users" can access this page no matter of their authentication. The not logged in user view:

Welcome!

SoftUni forum is a place, where you can post your questions, comment, and discuss problems, which you have in your programming language or in your study in SoftUni.

## Home page (Logged in)

The logged in user view:

Welcome!

SoftUni forum is a place, where you can post your questions, comment, and discuss problems, which you have in your programming language or in your study in SoftUni.

## Register (Not Logged in)

This is the register page ("localhost:4200/register"). This will be the **point** of your app that the fake **isLoggedIn property** can be changed to **true**. For now, we don't have a database with user registration. So, make sure **each registered** user is stored in **userService** or some other appropriate place. So, each of them can logged in successfully.

### Registration Form

*Username is required!*

## Themes page (Not Logged in)

This is the themes page ("localhost:4200/themes "). This is the page we already have. All "users" can access this page no matter of their authentication. By clicking the title of a theme, you will be redirect to the theme content view. It is described below. There are several differences between the logged and anonymous user. The anonymous user should see the following:

## Themes page (Logged in)

This is the themes page ("localhost:4200/themes ") for logged in users:

**Note\*:** Because you are still not really logged in, you can hardcode this `userId` ('5fa64b162183ce1728ff371d') in your service, to write your logic for subscribed users (Red and Green buttons).

## Create New Theme (Logged in only)

This is the create new theme page ("localhost:4200/themes ") where each **user** (logged in) can create his own theme.

- When "Post" button is clicked, you can try to make "POST" request to ("localhost:4200/themes") with the given theme information. After successful creation, **redirect** the current "user" to the **theme comments page** of his new created theme.
- When "Cancel" button is clicked, **redirect** the user to **home** page.

## Profile (Logged in)

This is the profile page ("**localhost:4200/profile**"). This page will show the information about the currently logged in user. For now, the data in this page will be **static**, except if you create more than the **fake isLoggedIn** property. The "Edit" button will replace the information fields with input fields, but this will be made in the next workshop, when you learn more about handling forms.

## Protected routes

Make sure all **user** (logged in) pages are **protected**. That means if your fake "**isLoggedIn**" **property** is **false** the logged in pages **can't be accessed**. Create authentication guards.

***GOOD LUCK!***
